FOOD DELIVERY MENU INTERFACE
(Full Stack Development Lab Project)

Live Demo:

https://naga-lakshmi10.github.io/food-delivery-menu-interface-FSD/

1. Project Title

Food Delivery Menu Interface

2. Objective

The objective of this project is to design and develop a responsive food delivery web application interface that allows users to browse food items, add them to a cart, and simulate ordering functionality using frontend technologies.

3. Project Description

This project is a frontend-based web application that simulates a real-world food delivery system. It provides an interactive and user-friendly interface where users can explore food items, manage their cart, and track orders.

The application uses HTML, CSS, and JavaScript, and stores user and cart data using LocalStorage, eliminating the need for backend integration.

4. Technologies Used

• HTML5 – Structure of web pages
• CSS3 – Styling and responsive design
• JavaScript (Vanilla JS) – Application logic and interactivity
• LocalStorage – Client-side data storage

5. System Requirements

Hardware Requirements

• Computer / Laptop
• Minimum 4GB RAM

Software Requirements

• Web Browser (Chrome, Edge, etc.)
• Code Editor (VS Code recommended)

6. Modules / Features

6.1 Home Page

• Displays landing interface

• Provides navigation to menu

6.2 Menu Module

• Displays food items

• Veg / Non-Veg filtering

• Add to cart functionality

6.3 Cart Module

• Displays selected items

• Calculates total price

• Allows item removal

6.4 Authentication Module

• Login and Signup system

• Stores user data in LocalStorage

6.5 Order Tracking Module

• Simulates order status updates

(Processing → Out for Delivery → Delivered)

7. Algorithm / Working Logic

• Display all food items on the menu page

• When user clicks Add to Cart, store item details in LocalStorage

• Update cart count and total price dynamically

• Allow users to remove items from cart

• Store login and signup details in LocalStorage

• On placing order, simulate order tracking stages

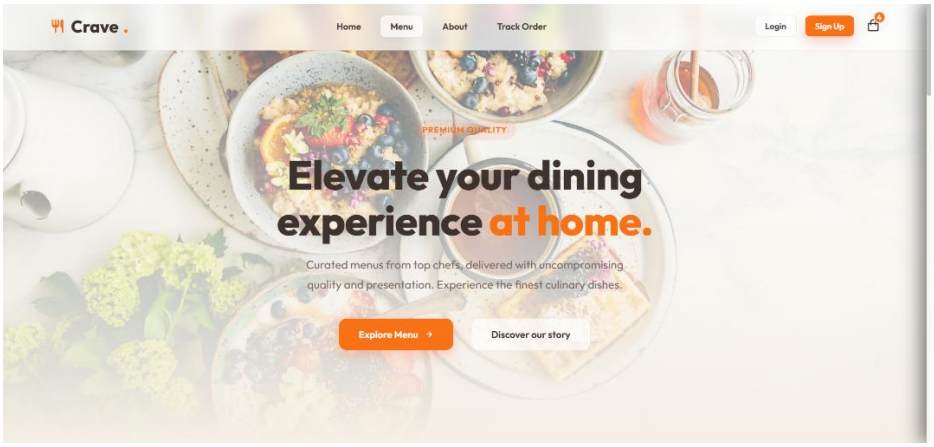
• Display order status to the user

8. Use Case

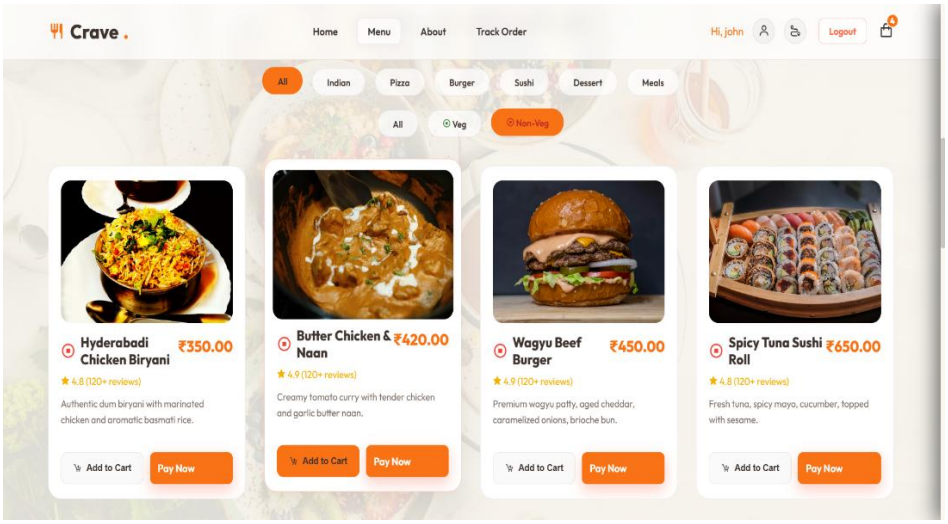
User opens the application, browses food menu, adds items to cart, logs in, places order, and tracks order status.

9. Screenshots

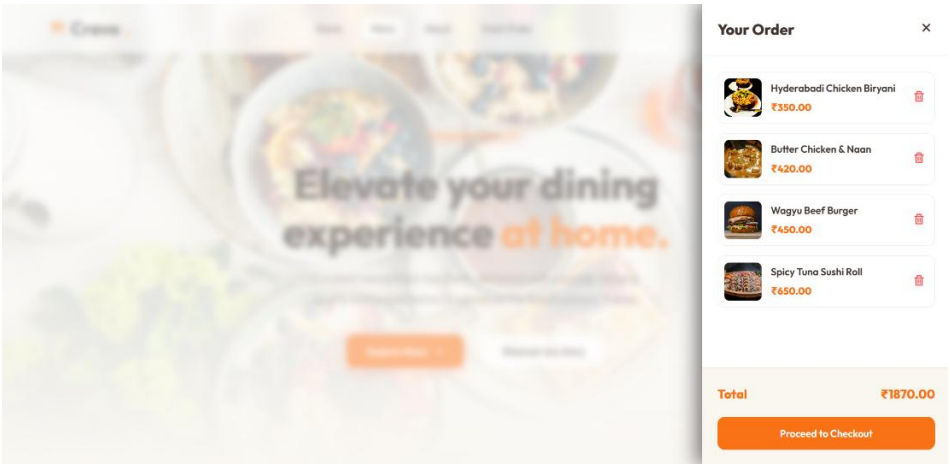
• Home Page



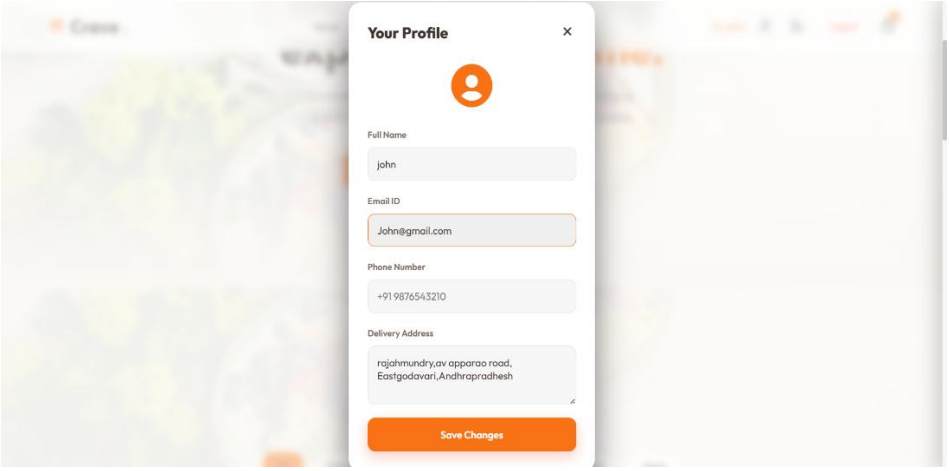
• Menu Section



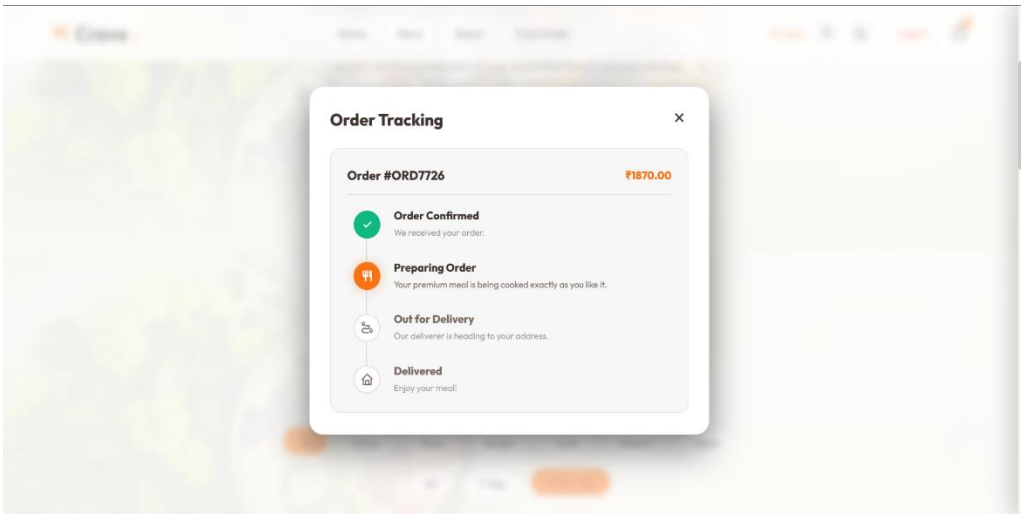
• Cart System



• **Login / Signup**



• **Order Tracking**



10. Project Structure

```

11. Advantages

• User-friendly interface

• No backend required

• Lightweight and fast

• Easy to understand and implement

• Suitable for beginners

12. Limitations

• No real database integration

• No payment gateway

• Data stored only in browser (LocalStorage)

• Not scalable for real-world applications

13. Future Enhancements

• Backend integration (Node.js / Firebase)

• Payment gateway integration

• Real-time order tracking

• Admin dashboard for management

14. Conclusion

The Food Delivery Menu Interface project successfully demonstrates the development of a responsive and interactive web application using frontend technologies. It provides a strong foundation for understanding real-world food delivery systems and can be extended into a complete full-stack application.
