CSE-E

Objective

- To design and develop a responsive Food Delivery Menu Interface
- To allow users to browse food items easily
- To simulate add to cart functionality
- To provide a simple and user-friendly UI
- To enhance understanding of front-end web development
- To improve understanding of DOM manipulation and JavaScript event handling

Project Overview

- This project is a web-based food ordering interface
- Built using HTML, CSS, and JavaScript
- Focuses on UI design and interactivity
- Displays food items with images, price, and categories
- Includes cart simulation feature

Technologies Used

- HTML – Structure of the webpage
- CSS – Styling and layout design
- JavaScript – Interactivity and cart logic
- GitHub Pages – Hosting the project
- VS Code – Development environment

Features

- Responsive food menu layout
- Category-based food display
- Add to Cart functionality
- Quantity update system
- Simple and clean UI design
- Mobile-friendly interface

Working Logic

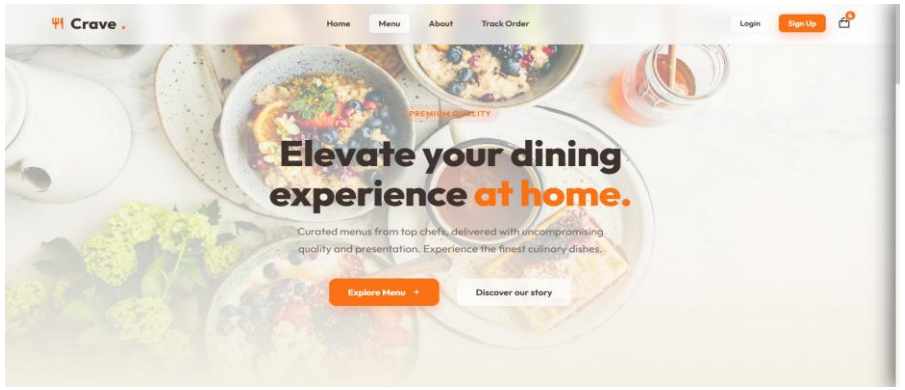
- User opens the food menu page
- Food items are displayed with images and prices
- User selects items and clicks Add to Cart
- Cart updates dynamically using JavaScript
- Total price is calculated automatically

System Flow

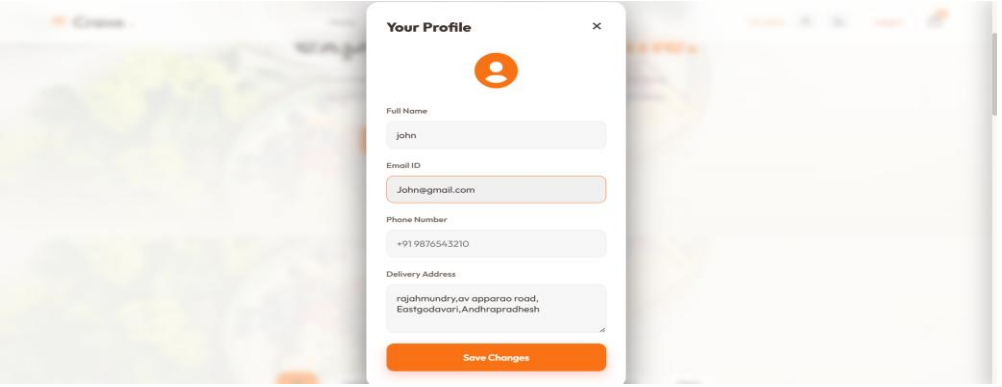
- Home Page loads menu
- User browses food items
- User adds items to cart
- Cart updates in real-time
- Final order summary is displayed

Screenshots

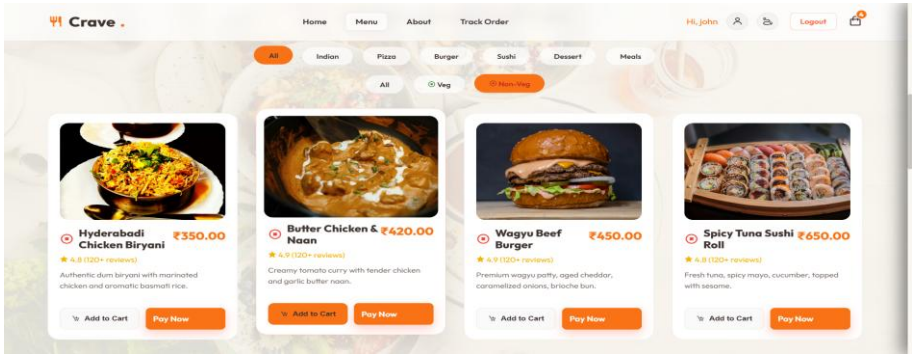
- Home Page



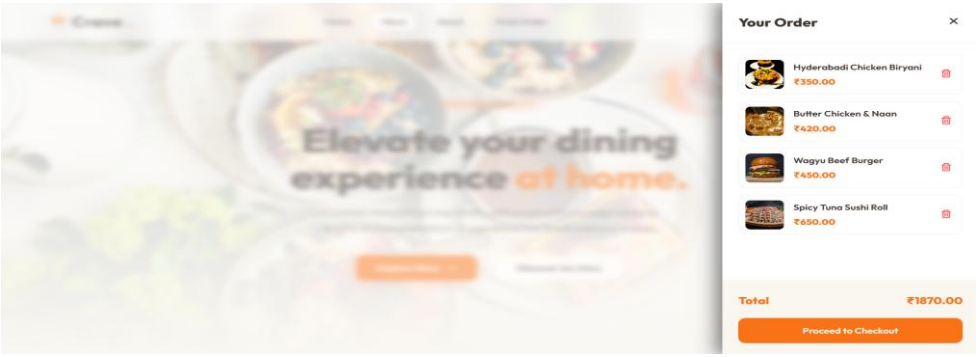
login page



- Menu page



cart page



Advantages

- Easy to use interface
- Fast food browsing system
- Lightweight and responsive design
- Helps users understand ordering flow
- Good practice for web development skills

Limitations

- No backend database integration
- No real payment system
- No user login system
- Data is not permanently stored

Future Enhancements

- Add backend using Node.js or PHP
- Implement user login & authentication
- Integrate payment gateway
- Add real-time order tracking
- Store data in database (MySQL / MongoDB)

Conclusion

- The project successfully demonstrates a Food Delivery Interface
- It helps understand frontend development concepts
- Provides a basic simulation of online ordering systems
- Can be expanded into a full-stack application in future
